

FIG. 84.—Bronchiole involved in an inflammatory reaction of the surrounding tissue, which extends to the submucosa. There is an early purulent bronchiolitis. Organisms which are morphologically pneumococci are present in the exudate in the alveoli surrounding this bronchiole. The inflammation in the alveoli is fibrinous in character. The reaction about the bronchiole is an interstitial type not distinguishable from that produced by the streptococcus. Accession number 1385, Army Medical Museum. Negative number 45277. Hematoxylin and eosin stain; $\times 130$
